

Underground Propane tank Owners

Has your Cathodic Protection (Anode bag) been tested on your underground propane tank in the past 3 years?

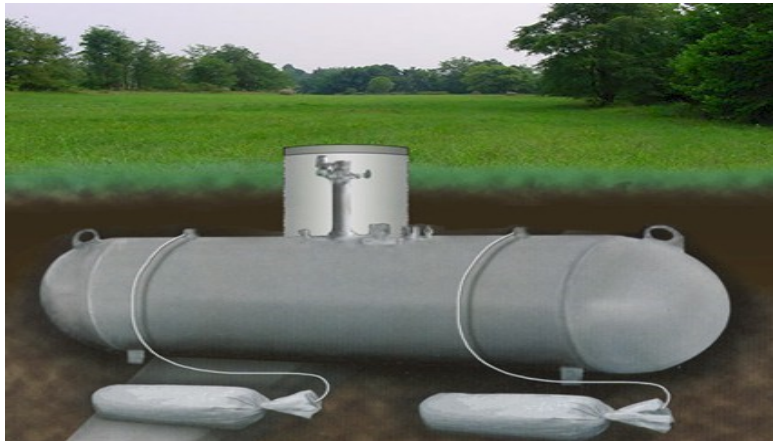

Every underground propane tank has at least (1) anode bag installed to help prevent corrosion at the time of installation.

Without proper protection, a tank is vulnerable to corrosion, which results into a possible leak.

According to the NFPA 58 LP-GAS codes, this **MUST** be done in intervals not to exceed 36 months.

Depending on your soil type, these anode bags could be consumed in as little as 6 years.

This is why there is a periodic test in place to make sure your underground propane tank will continue to be protected from corrosion and any unwanted leaks.

For **\$99.00** Service Oil Company will send out one of their certified technicians to administer the tests needed to assure your tank lasts for years to come. If there would be any problems with your anode, the technician will let you know how to resolve the issue at hand and the cost to repair. Please call today to schedule your test.
